Category:CorelKAMPALA, Uganda — A new U.N. report that challenges the validity of Uganda's 2010 election results has been obtained by The New York Times and will be published on Sunday, an official from the election commission said on Thursday. The commission, headed by Paul Kagame, the country's president-elect, declared that President Yoweri Museveni had won an 11th consecutive term. Mr. Museveni, who has been in office since 1986, is expected to be sworn in on Friday. While Mr. Museveni, 69, has said he would respect the results, opponents have demanded a new election. The report, which was obtained by The New York Times, was prepared by investigators from the Inter-Parliamentary Union, the world's largest

organization of parliamentary bodies. They wrote that more than 50 percent of the nearly 300,000 votes counted for Mr.

Museveni in the election were fraudulent.

Q: Mongoose Schemas: How can I limit a search to a subset of fields? I'm using Mongoose to build a searchable document model. A document looks like this: { _id: ObjectId("xxx"), user_id: ObjectId("yyy"), "topic_id": ObjectId("zzz"), ... } How can I create a search, that will query the documents where all the given fields match? For example, I need to find all documents where the id matches the id of a given document. The model definition looks like this: Topic.findById({ _id: mongoose.Types.ObjectId(id) },function(err, doc){...}); A: If you use the dot notation you can limit your search to what you are looking for. For example: Topic.find({ "topic_id": { \$in: [mongoose.Types.ObjectId(id)] }, "user_id": { \$in: [ObjectId(id)] } },function(err, doc){...}); To make this work you need to ensure that the user can only access the field that is being used. You could do this in any number of ways, but the most straight forward one
