Cited by 1 Joint professorship in the Department of Statistics, Utkal University, Bhubaneswar (OU-JPR-1675). . Department of Statistics, Utkal University, Bhubaneswar, India (OU-JPR- 1675) 2016 Cited by 3 Cited by 1 Modified linear-quadratic treatment planning (MLQT) is a combined, dose-volume-weighted linear-quadratic (LQ) model used in radiotherapy practice to estimate the biological effect of the dose delivered to the tumour. Linear-quadratic, however, is a theoretical model and may not be valid for many tumour types. As such, the modified linear-quadratic (MLQT) LQ model is derived from the baseline linear-quadratic (LQ) model and the Gompertz model of cell kill. An advantage of the MLQT model is that it has a simpler one-to-one correspondence with the corresponding LQ model. Thus, the MLQT model can be directly used in treatment planning and dose-response assessment. In this study, we compared the LQ, MLQT and gamma models and discuss their use in dose-response analysis and treatment planning. We also present a unique advantage of the gamma model by considering the interpatient variability in tumour control probabilities due to variability in normal tissue sensitivity. Recommendations of the MLQT model over the other dose-response models and
