A: You should try installing the updates via Windows update. They are normally available for a couple of weeks after the update to a new version of the software is released. Note that updating the software doesn't mean you have to install a new map for your TomTom. You just have to restart your navigation device and you are good to go. It is possible that your map becomes outdated, but this is not a problem, since you can just change the map and you are good to go. Just check the TomTom website before you update the software and before you update the map, to make sure it is up to date. If you have a new navigation device, then I assume it is compatible with all the European maps that are available for Windows. It might be helpful to check with your TomTom support to make sure. You have to make sure that the navigation device has enough storage space available, so you won't run out of space in the future. Q: Understanding the relation between field and tensor in general relativity While learning about general relativity, I'm a bit confused about some of the terminology. Here are the two definitions that I'm familiar with. The idea of field is to represent an object that moves in spacetime. A tensor is an object that represents tensor fields. The problem is that a tensor field can be specified by its components. If we have a S^4 -tensor $ST_{[ab]}$ with components $ST_{[ab]} = T_{[0a]} \delta^{[0]_b}$, does it mean that the S^4 -tensor is a field? If yes, what is the relation between the S^4 -tensor and the vector field? A: A S^p -tensor is one that can be represented by a collection of S^p tensors. A S^p -tensor is a function of S^p vector fields. A S^p -tensor field is a function that acts on S^p vector fields. A vector field can be represented by a vector. A tensor field can be represented by a tensor. A vector field and a tensor field are two distinct objects. If we have a S^4 -tensor $ST_{[ab]}$, can we say that it is a field or not? No. 2d92ce491b
