How to download SamLogic MultiMailer Professional Description: Purchase SamLogic MultiMailer Professional from the PlatformTools website.The present invention relates to wire bonding, and, more particularly, to an improved wire bonding method and a bonding ball formed therefrom that exhibits a high bond strength without fracturing. Conventional wire bonding methods and apparatus are described, for example, in U.S. Pat. No. 4,548,065 issued to John E. Bennett et al. on Oct. 22, 1985 and U.S. Pat. No. 4,523,205 issued to Uwe D. Klein, et al. on Jun. 18, 1985. In a conventional wire bonding process, a relatively thin, for example, approximately 0.001 inches, wire is supplied from a capillary to a bond site on a semiconductor wafer where it is heated to form a ball that is bonded to an active surface of the semiconductor wafer. A capillary is generally used to position the wire and to move the wire during a bonding operation, and is especially important in order to control the shape of the formed ball or to position the formed ball on an electrical trace of an integrated circuit chip on the semiconductor wafer. A capillary provides a jet orifice through which a fine wire is supplied, and an upper end of the capillary is adapted to contact the wire when the wire is positioned over the orifice. The wire is held in place under a slight tension to prevent the wire from adhering to the walls of the capillary and/or the orifice. An upper end of the capillary has a tip to which an electrical field can be applied to form a flow of electrical current in the wire, which in turn forms a current that heats the wire to a temperature sufficient to form a ball. The pressure applied to the tip of the capillary against the ball is preferably between approximately 0.4 and 1.0 milliamps with a peak current of approximately 50 milliamps or more for 1/2 second or greater. The wire is raised from the capillary prior to bonding so
