The smallest known craters (smallest number of kilometer diameter) on Mars are impact basins formed by asteroids and comets impact from about a million years to a few million years ago. They are named in a human scale size order, by the ratio of their diameter (in km) to their distance (in meters) from the center of Mars. There are several online tools that allows you to make a crater, but some of them are not that user-friendly. On the other hand, AutoCAD is an application that, firstly, is easy to use and, secondly, you can do a lot with it. Let's see the steps to create a crater in a very simple manner using AutoCAD: STEP 1: In the first step, we need to prepare a scene. Start AutoCAD and open a new file. Click on File » Open and click on either Design or Textures. Click on New » Create and click on From File. Select the Size and click on OK. In the Create A New Project dialog box, type the name, and click on OK. In the following dialog box, click on OK. STEP 2: After creating a new project, we need to create a simple geometry. In the image above, you can see that we have a circle in our scene. The circle is a good source of a crater. In the next step, we can make a crater by extruding that circle (make a portion of it) until it gets near to the edge of the earth. This is possible if we make a view in our model at a slight angle. In the image above, the yellow line shows the red circle and the blue line shows the resulting crater. STEP 3: In the next step, we can easily rotate and move the elements of our model. Click on the circle and select the Move tool. Click and drag the circle until it touches the edge of the earth. From the move tool ribbon, choose the Free Transform tool and select the circle. Use the rotate and scale tools to rotate and scale the circle. Click on the black arrow next to the yellow line to make the crater. STEP 4: In the next step, we can easily change the orientation of our model. The model is placed on the left side of the

## What's New in the AutoCAD?

Markup Import allows you to import feedback from printed paper or PDFs and automatically apply it to your drawing. You can add comments and even mark-up the import source with arrows, cross-hairs, or other symbols as you create a new drawing. The comments and symbols from the import source are automatically imported into your drawing, and changes are made as necessary. After importing the feedback, you can add, edit, or delete it as if it were your own design. Rapidly send and incorporate feedback into your designs. (video: 1:15 min.) Markup Assist helps you achieve better results in your own design process. You're always free to stop and modify the import as needed—no need to continue to import and incorporate the feedback and wait to start the next drawing. Markup Assist automatically applies feedback to your drawings, right on the drawing canvas, without additional steps or drawing changes. For example, you can use your print-outs to add to your design and track changes by using AutoCAD's marker tools. Markup Assist lets you track your design history by marking changes in the feedback on the drawing canvas. Reduce background noise: A new "HUD" window reduces the noise caused by other tools while you work. With the HUD, other tools are masked out of your viewport. By default, the HUD is displayed when you move the mouse cursor over the drawing canvas. To enable or disable the HUD, click on the HUD button on the status bar. (The settings are saved with the AutoCAD Preferences dialog.) The HUD window is also displayed in two other ways: When you use the ribbon toolbars: When you use the Ribbon Tool Panel: Use the new "Zoom" tool: The new Zoom tool lets you zoom in and out of the viewport to work efficiently with various sizes of elements. Move and resize drawings: You can use a new command to quickly move and resize the drawing canvas. With the new CommandButton or the Drafting toolbar, choose Draw on canvas. The command brings up a dialog box that shows the current drawing canvas size and center point. Click the grid to move the canvas to any position on the current drawing canvas.
