For now, we'll assume that these computations are happening within the same process. So how to use channels in Javascript ES6? Thanks. A: To use channels, you first need to enable them in your environment: npm install --save-dev es6-promise-channels Then, to use them, you need to create a Channel, const Promise = require('es6-promise').Promise; const Channel = require('es6-promise-channels').Channel; const channel = new Channel(); channel.send(42); channel.close(); To receive values, you just need to listen to the data coming in: channel.on('data', (data) => { // data can be received as soon as the remote process sends it, // but it may be delayed depending on the amount of data console.log(data); }); To allow sending to multiple processes at the same time, you can use, const channel = new Channel(3); channel.send(42); channel.send(42); channel.send(42); What this does is, it sends the message to the channel three times. If you want the message sent only once, you can use channel.publish(), channel.publish(42); This will send the message once, no matter how many times you send the message to the channel. Q: Reference request on the intersection of two subgroups Let H be a subgroup of G, and N a normal subgroup of G. Is it true that the intersection of H and N is always a subgroup of HN, where $HN=\{hn\mid h\in H,n\in N 3e33713323
