When you hear the word Orbital, you think about planets. All the planets in the solar system follow elliptical orbits. The fact is, all the objects that travel in the Solar System do not move in circles but an ellipse. The moon moves around the earth in an ellipse, both planets move around the sun in an ellipse and some of them move in ellipses around their own sun in order to maintain their orbits. Another word used in this context is Orbital Velocity, and it is the measure of the velocity of a celestial object with respect to a central mass. And this is what orbital mechanics is all about. Let's see in detail how the whole thing works. The elliptical orbit In general, an object's orbital motion is a path that an object traces out in space over time. When an object moves in an elliptical orbit, it follows the long axis of the ellipse at a certain speed, called orbital velocity. The more an object travels on its elliptical orbit, the more its orbital velocity increases. If the object is following a circular orbit, its velocity is constant and the same for all the time. The orbital path of an object is also called a Keplerian path. Keplerian motion Kepler's laws are simply a framework that explains the motion of celestial bodies. Kepler's first law determines that the object keeps travelling around a point at a certain speed, which is the orbital velocity. Kepler's second law describes a law of ellipses, and it states that a conic section is a figure that is drawn with a fixed ratio of its length to its width and its distance from the center. Kepler's third law is concerned with the area of a conic section. And now you know, with a little bit of maths, the orbital motion of an object in the Solar System. Interstellar spaces Another important aspect of celestial mechanics is the space between the planets and stars. Astronomers define the distance between the Sun and the Earth as the solar radius, which is the distance between the Earth and the Sun. Since the distance between any two celestial bodies is expressed in astronomical units (AU), the solar radius is divided by some factors. This is how you get the heliocentric distance of the Earth. This is a figure that is used to express the distance of the Sun from the Earth.
